

HPR Pressure Relief Tool

A very common problem when a machine or implement is left unused the hydraulic pressure in the hoses can build up to a point where the quick couplers can't be connected. The wrong way to release the pressure is to hit the poppet in the couplers with a hammer or similar tool. This can damage the coupler to the extent where it has to be replaced. Another dangerous way is to loosen the connection, this can be very dangerous to the person (Oil Injection) and also damages the environment.

The HPR tool can relieve the pressure in seconds with a few turns of the handle.

There is a machined groove to guide the residual oil safely either into a receptacle or simply use a cloth to catch the small amount of oil.

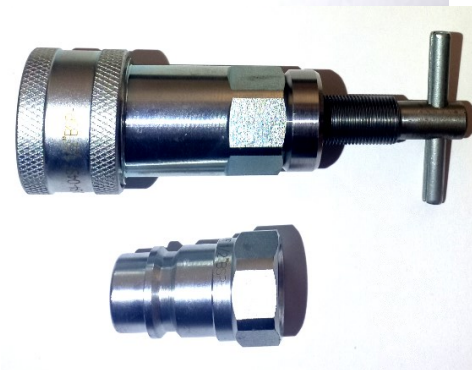

HPRF-08

**Fits all 1/2 ISO A and ISO 5675
Nipples**

HPRM-08

**Fits all 1/2 ISO A and ISO 5675
Couplers**

HPR-08

**Male & Female coupler with
one rod & bush**

WARNING

**These tools are not to be used to relieve full pressure in a hydraulic system.
Use the procedure recommended by the machine manufacturer to
de-pressurise the system.**
