

HPR “Hydraulic Pressure Relief Tool”

A very common problem when a machine or implement is left unused and in the sun the residual pressure in the hose can build up to a point where the quick couplings can't be connected.

The wrong way to release the pressure is to hit the poppet or ball in the coupler with a hammer or similar tool.

This can damage the coupler or nipple to the extent where it has to be replaced.

Another dangerous way to release the pressure is to loosen the hose connection, this can be deadly to the person with Oil Injection and it's not good for the environment.

The HPR tool can relieve the pressure safely and controlled in seconds with just a few turns of the handle.

Simple to use:

- ◆ Always wear eye protection
- ◆ Attach the female or male coupler to the pressurized side.
- ◆ Place a rag over the coupler to catch any oil released
- ◆ Screw the handle until the rod connects with the poppet or ball, half a turn and the pressure will be released.

HPRMF-08
Male & Female Set

PRM-08
Male Tool

PRF-08
Female Tool

These tools are not to be used to relieve full system pressure. Use the procedure recommended by the machine manufacturer to de-pressurize the system.
